1 – What You're Doing and Why It Matters

MLI Rubrics Project – Lesson 1.mp4

Objective

Welcome to the MLI Rubrics Project! You're stepping into a highly specialized, high-impact initiative designed to push the limits of AI across some of the most intellectually demanding fields like **finance, medicine, law, consulting, or whatever your professional field of expertise is.**

In this lesson, we'll discuss:

- The mission of this project
- The transformative impact your work can have on the future of AI
- The critical role you'll play as a domain expert

What Is the MLI Rubrics Project?

The MLI Rubrics Project is a global effort to build a **library of expert-crafted tasks and rubrics** that test and train the most advanced AI models, not on general trivia or casual reasoning, but on the **deep, specialized workflows used by top-tier professionals.**

We are setting the bar for what AI must achieve to be truly useful in fields like:

- Investment Banking & Finance
- Medicine & Healthcare
- Law & Legal Reasoning
- Management & Strategy Consulting

This isn't just about answering questions. It's about teaching AI how to think, reason, and deliver insights like a seasoned practitioner.

Why This Work Matters

While AI models like Gemini are getting smarter, they still struggle when faced with:

- Multi-step reasoning in complex professional scenarios
- Synthesizing technical information across documents
- Adhering to the structured logic that experts apply every day

Imagine an AI that could draft a flawless M&A pitch book like a top investment banker, diagnose a rare condition based on nuanced case data like an expert clinician, build a watertight legal

argument backed by case law, or design a boardroom-ready market entry strategy for a Fortune 500 company. We're not there yet. But with your help, we will be.

Your Role on the Project

You'll design prompts, source or create grounding documents, and develop rubrics that objectively evaluate how well a model responds to a complex, professional-grade task.

As a writer, your mission is to:

- Create tasks that simulate real professional workflows, not just textbook questions
- Ensure that memory alone won't help the LLMs solve the problem. The tasks should require deep reasoning, synthesis, and expert-level judgment
- Craft clear, actionable rubrics that define what a high-quality expert response looks like

The Broader Impact of Your Work

Your contributions will:

- Help train AI models to reason and perform like real experts in fields where precision, insight, and sound judgment matter
- Benchmark the performance of frontier models against real-world professional standards
- Shape how future AI tools support – and augment – experts across industries

By participating in Argentum, you're helping build an AI that can collaborate with professionals, accelerate workflows, and enhance decision-making in the world's most complex domains.

This is your chance to shape how AI is used in boardrooms, operating rooms, courtrooms, and deal rooms around the world.

What's Next?

Now that you understand the purpose and impact of Project Argentum, the next module will guide you through **exactly how to write a high-quality prompt** – including how to structure it, source the right supporting documents, and build an effective evaluation rubric.
