Dear family member of Sabah Ul Hasan,

This letter is to inform you of medical test results of Sabah Ul Hasan's that may have some meaning to you. As you know, there is a history in your family of cancer. Sabah Ul Hasan took a genetic test to see if the cancer pattern in your family could be explained by an underlying hereditary cause. As shown in the attached test result, a mutation (difference/change) was found in one of their *SDHB* genes. The mutation is a pathogenic variant in the *SDHB* gene known as p.C68F and causes cells to function poorly under oxidative stress.

Everyone has two copies of the *SDHB* gene. In your relative's case, one copy of their *SDHB* gene is mutated (changed) and cannot protect their body from cancer as well as it should. As a mutation carrier, individuals are not certain to get cancer, but do have a higher chance over the entire lifetime. *SDHB*-related cancer risks mainly include renal or adrenal tumors or cancer.

First-degree relatives to Sabah Ul Hasan (parents, brothers, sisters, and children) have a 50% chance of having this same gene change. Second-degree relatives (grandparents, aunts, uncles, nieces, nephews, half siblings) have a 25% chance. Once a family's gene change has been identified, testing on other family members is quick and simple, and usually costs less than $250 (available through many labs such as Ambry, Invitae, etc and is usually covered by insurance). Ambry Genetics offers free testing for Sabah Ul Hasan's gene difference to relatives within 90 days of this report date when ordered by a healthcare provider. After those 90 days, testing is available by self-pay or insurance bill. There is an additional finding on Sabah's panel test called a variant in the *TP53* gene, which is not known to be significant at this time, but may mean you wish to choose a panel test instead of single-site for the *SDHB* mutation. This would be good to discuss with the genetics professional ordering your test.

If you undergo testing and are found to have the same *SDHB* gene mutation as your relative, you could choose to undergo more cautious screening. These recommendations are published by the National Comprehensive Cancer Network (NCCN) and other professional bodies.

The best way to go about getting more information and/or testing is through a genetic counselor. Ask your personal physician to refer you for genetic counseling and bring the attached test results with you to that appointment. We are glad to see you at the Sharp Cancer Genetics Program. Other genetic counselors can be found at https://findageneticcounselor.nsgc.org.

Ask your physician for a referral to a cancer genetic counselor for genetic testing of a familial *SDHB* variant and provide the attached report. We wish you all the best and are here to support your decision-making around your health.

Kind Regards,
Brittany Burnett, MS, LCGC
